I don't know what Apple is doing on these OLED screens, but they are clearly not as scratch resistant as the LCDs.

I've had two iPhone X phones since release (first one took a dunk in a pool that killed it 3 months after I got it— thank god for Applecare+). On both phones, fine scratches started appearing almost immediately on the displays. This is even with a case that sticks up a bit and doesn't allow the screen to be laid flat. Just from sitting in my pocket with whatever dust is in there. I always keep that pocket empty except for my phone.

I've owned previous iPhones for up to 3 years without a single visible scratch ever developing on them.
